This paper reviews previous studies on iron and steel oxidation in oxygen or air at high temperatures. Oxidation of iron at temperatures above 700 $\hat{\circ}$ C follows the parabolic law with the development of a three-layered hematite/magnetite/w $\hat{\sim}$ 1/4stite scale structure. Plasticity in a crystal of pure metal is primarily caused by two modes of deformation in the crystal lattice: slip and twinning. Slip is a shear deformation which moves the atoms through many interatomic distances relative to their initial positions.
